Key.Q: How to get index value from multidimensional array I'm using a module to generate a dynamic set of options to be
passed to a mySQL query to generate a rank list. The module keeps an array of the top 10 most popular tags on various articles,
however I only need the value of the selected tag. The module is generating the array like this: \$array =
(array)\$tags['tags']['#tags']; It should be noted that \$tags['tags']['#tags'] is an array of arrays. My problem is, in the form, I select
a tag using the following: " When I do the following: \$tags = array(); \$tags = array_keys(\$array); \$tags = print_r(\$tags, 1); The
print_r gives me an array of indices like this: Array ([0] => 4) What I need is just the index of the '#tags' within the array that
was selected, like so: [4] => 4 So I can use the value from the index to post to mySQL later like this: \$tags = array(); \$tags =
array_keys(\$array); \$tags = \$array[4] => 4; \$tags = print_r(\$tags, 1); What would be the best way to do this? A: \$array is a
multidimensional array as you said. You can use array_values() to get one dimensional array. The present invention relates
generally to the field of semiconductor device fabrication and, more particularly, to the fabrication of metal gate electrode
structures for complementary metal oxide semiconductor (CMOS) devices. As the gate length of MOS transistors decreases
below 0.5 μm , the channel resistance of a CMOS device becomes a significant factor in chip performance. A significant
